Abstract Poche idee, ben confuse.

## 1 Introduction

## 2 Preliminaries

The finite (fractional) expansion of a structure M is a many-sorted expansion that has a sort for M, which we call the home-sort, a sort for  $\mathbb{R}$ , the set of real numbers, and a sort for the finite fractional multisets of elements of  $M^n$ , for any  $n < \omega$ . A (fractional) multiset is a function  $s: M^n \to \mathbb{R}^+ \cup \{0\}$ . We say that s is finite if it is almost always 0. We interpret s(a) as the number of occurreces of a in s. For this reason, we use the following suggestive notation:

1. 
$$a \in s = s(a)$$
 this is called the multiplicity of  $a$  in  $s$ ;

2. 
$$|s| = \sum_{a \in M} a \in s$$
 this is called the size of  $s$ ;

3. 
$$\left|\left\{a \in s : \varphi(a;b)\right\}\right| = \sum_{a \models \varphi(x;b)} a \in s$$

We call these multisets samples of  $M^n$ .

We will write  $M^f$  for the expansion above. The language of  $M^f$  is denoted by  $L^f$ . It expands L and the language of arithmetic. Moreover,  $L^f$  has a symbols for the functions in 1-3 above. In particular, claim 3 requires a symbol for every  $\varphi(x;z) \in L$ .

Let  $\mathcal{U}$  be a monster model of cardinality  $\kappa$ , an inaccessible cardinal larger than the cardinality of L. The hyperfinite expansion of  $\mathcal{U}$  is a saturated elementary extension of  $\mathcal{U}^f$  of cardinality  $\kappa$ . We will write  $\mathcal{U}^{f*}$  for this expansion. As all saturated models of cardinality  $\kappa$  are isomorphic, we can assume that  $\mathcal{U}$  is the home-sort of  $\mathcal{U}^{f*}$ .

We write  $\operatorname{supp}(s)$  for the support of s, that is, the subset of  $\mathbb{U}^n$  where  $x \in s$  is positive. Note that  $\operatorname{supp}(s)$  is a definable subset of  $\mathbb{U}^{f*}$ , hence its cardinality is either finite or  $\kappa$ . Moreover,  $s \subseteq M^n$  for some small model M, then  $\operatorname{supp}(s)$  is finite.

If *s* is a sample in  $\mathcal{U}^{f*}$ , we write  $s \subseteq \mathcal{U}^n$  as a shorthand of supp $(s) \subseteq \mathcal{U}^n$ .

**2.1 Fact** Every model M is the domain of the home-sort of some  $M^f \preceq U^{f*}$ .

Proof Difficile da scrivere senza hand-waving.

Let  $s\subseteq \mathcal{U}^{|x|}$  be a sample. For every formula  $\varphi(x;z)\in L$  and every  $b\in \mathcal{U}^{|z|}$  we define

$$\operatorname{Av}_s \varphi(x;b) = \frac{\left|\left\{a \in s : \varphi(a;b)\right\}\right|}{|s|},$$

Below,  $\varepsilon$  always ranges over the positive standard reals. If a and b are hyperreals, we write  $a \approx_{\varepsilon} b$  for  $|a - b| < \varepsilon$ . We write  $a \approx b$  if  $a \approx_{\varepsilon} b$  holds for every  $\varepsilon$ . We write  $\operatorname{st}(a)$ , for the standard part of the hyperrational number a. That is, the unique real number  $\mu$  such that  $\mu \approx a$ .

The standard part of  $Av_s$  induces a finite probability measure on the algebra of definable subsets of  $\mathcal{U}^{|x|}$ . This measure has an unique extension to a Lebesgue probability measure on a  $\sigma$ -algebra. This is known as the Loeb measure.

**2.2 Theorem** Let  $\varphi(x;z) \in L$  be a nip formula. Let M be a model. For every sample  $s \subseteq \mathcal{U}^{|x|}$ , and every  $\varepsilon$ , there is a sample  $s_{M,\varepsilon} \subseteq M^{|x|}$  such that  $\operatorname{Av}_s \varphi(x;b) \approx_{\varepsilon} \operatorname{Av}_{s_{M,\varepsilon}} \varphi(x;b)$  for all  $b \in M^{|z|}$ .

Moreover, the cardinality of  $s_{M,\varepsilon}$  soley depends on  $\varepsilon$ , namely

$$|s_{M,\varepsilon}| \le c \frac{k}{\varepsilon^2} \ln \frac{k}{\varepsilon}$$

where c is an absolute constant and k is the VC-dimension of  $\varphi(x;z)$ .

Proof Questo è Vapnik-Chervonenkis.

**2.3 Lemma** For every nip formula  $\varphi(x;z) \in L$ , every sample  $s \subseteq \mathbb{U}^{|x|}$  and every infinite  $B \subseteq \mathbb{U}^{|z|}$  such that  $\operatorname{Av}_s \varphi(x;b) > \varepsilon$  for every  $b \in B$ , there is a finite cover of B, say  $B_1, \ldots, B_n$ , such that all types  $p_i(x) = \{\varphi(x;b) : b \in B_i\}$  are consistent.

**Proof** Let M be any model containing B. Fix some  $\varepsilon' < \varepsilon$ . Let  $s_{M.\varepsilon'}$  be the sample given by Theorem 2.2. Then  $\operatorname{supp}(s)$  is finite, say  $\operatorname{supp}(s) = \{a_1, \ldots, a_n\}$ . Let  $B_i = \{b \in B : \varphi(a_i; b)\}$ . As  $\operatorname{Av}_{s_{M.\varepsilon'}} \varphi(x; b) > 0$  for all  $b \in B$ , these  $B_i$  are the required cover of B.

**2.4 Corollary** Let  $\psi(x;z) \in L$  be a nip formula and let  $s \subseteq \mathcal{U}^{|x|}$  be a sample. There is no infinite set C such that  $\operatorname{Av}_s[\psi(x;c) \not\leftrightarrow \psi(x;c')] > \varepsilon$  for all  $c,c' \in C$ .

**Proof** Apply Lemma 2.3 to the folmula  $\varphi(x;z,z') = [\psi(x;z) \leftrightarrow \psi(x;z')]$  and the set  $B = C^2$ . Without loss of generality, we may assume that the sets  $B_i$  given by the lemma form a partition of the complete graph on C. By the Ramsey theorem there is an infinite  $A \subseteq C$  such that  $\{\psi(x;a) \leftrightarrow \psi(x;a') : a,a' \in A, a \neq a'\}$  is consistent. Clearly this is a contradiction as soon as |A| > 2.

The following is another immediate consequence of the lemma.

**2.5 Corollary** For every nip formula  $\varphi(x;z) \in L$ , every sample  $s \subseteq \mathbb{U}^{|x|}$  and every sequence of indiscernibles  $\langle b_i : i < \omega \rangle$  such that  $\operatorname{Av}_s \varphi(x;b_i) > \varepsilon$  for every  $i < \omega$ , the type  $\{\varphi(x;b_i) : i < \omega\}$  is consistent.

- **2.6 Remark** ??? When the model M in the theorem above is sufficiently (?) saturated, we can claim that there is a (necessarily finite) sample  $s_M \subseteq M^{|x|}$  such that  $\operatorname{Av}_{s}\varphi(x;b) \approx \operatorname{Av}_{s_{M}}\varphi(x;b).$ **2.7 Definition** Let  $\varphi(x;z) \in L$ . We say that the sample  $s \subseteq \mathcal{U}^{|x|}$  is invariant for  $\varphi(x;z)$ over M if, for every  $s' \equiv_M s$  and every  $b \in \mathcal{U}^{|z|}$ , we have  $\operatorname{Av}_s \varphi(x;b) \approx \operatorname{Av}_{s'} \varphi(x;b)$ . For invariant samples the Vapnik-Chervonenkis Theorem can be strengthened as follows. **2.8 Corollary** Let  $\varphi(x;z) \in L$  be a nip formula. Let M be any model. For every sample  $s\subseteq \mathcal{U}^{|x|}$  that is invariant for  $\varphi(x;z)$  over M, and every  $\varepsilon$ , there is a sample  $s_{M,\varepsilon}\subseteq M^{|x|}$ such that  $\operatorname{Av}_s \varphi(x;b) \approx_{\varepsilon} \operatorname{Av}_{s_{M_{\varepsilon}}} \varphi(x;b)$  for all  $b \in \mathcal{U}^{|z|}$ . **Proof** By the theorem above, there is a sample  $s_{M,\varepsilon} \subseteq M^{|x|}$  such that  $\operatorname{Av}_s \varphi(x;b) \approx_{\varepsilon}$  $\operatorname{Av}_{s_{M,\varepsilon}} \varphi(x;b)$  for all  $b \in M^{|z|}$ . Suppose for a contradiction that  $\operatorname{Av}_s \varphi(x;b') \not\approx_{\varepsilon} \operatorname{Av}_{s_{M,\varepsilon}} \varphi(x;b')$  for some  $b' \in \mathcal{U}^{|z|}$ . Pick a sample  $s' \subseteq \mathcal{U}^{|x|}$  such that  $b' \downarrow_M s' \equiv_M s$ . By invariance,  $\operatorname{Av}_{s'} \varphi(x;b') \not\approx_{\varepsilon}$  $\operatorname{Av}_{S_{M,s}} \varphi(x;b')$ . As  $b' \downarrow_M s'$ , the same formula holds for some  $b \in M^{|z|}$ . Once again by invariance,  $\operatorname{Av}_s \varphi(x;b) \not\approx_{\varepsilon} \operatorname{Av}_{s_{M,\varepsilon}} \varphi(x;b)$ . A contradiction. The following is stronger form of invariance. **2.9 Definition** We say that a sample  $s \subseteq \mathcal{U}^{|x|}$  is smooth for  $\varphi(x;z)$  over M if for any other sample s' such that  $Av_s \varphi(x;b) \approx Av_{s'} \varphi(x;b)$  for all  $b \in M^{|z|}$ , the same equivalence holds for all  $b \in \mathcal{U}^{|z|}$ . Clearly, smooth impies invariant. **2.10 Definition** ??? A sample  $s \subseteq \mathcal{U}^{|x|}$  is finitely satisfiable for  $\varphi(x;z)$  in M if, for every  $b \in \mathcal{U}^{|z|}$  such that  $\operatorname{Av}_{s} \varphi(x;b) \not\approx 0$ , there is  $a \in M^{|z|}$  such that  $\varphi(a;b)$ . We say that s is generically stable for  $\varphi(x;z)$  over M if it is both invariant and finitely satisfiable for  $\varphi(x;z)$  over M. **2.11 Definition ???** A formula  $\varphi(x;z) \in L$  is distal if there is a formula  $\psi(x;z_1,\ldots z_n) \in L$ such that for every finite sample s and every  $b \in \mathcal{U}^{|x|}$  there are  $a_1, \ldots, a_n \in s^{|z|}$  such that  $\psi(x; a_1, ..., a_n) \leftrightarrow p(x)$ , where  $p(x) = \operatorname{tp}_{\omega}(b/...s)$ . **2.12 Theorem (false)** The following are equivalent
  - 1.  $\varphi(x;z) \in L$  is distal;
  - 2. *if s is generically stable for*  $\varphi(x;z)$  *over M then s is smooth for*  $\varphi(x;z)$  *over M.*
