Abstract Poche idee, ben confuse.

1 Introduction

2 Samples

The finite (fractional) expansion of a structure M is a many-sorted expansion that has a sort for M, which we call the home-sort, a sort for $\mathbb{R}$, the set of real numbers, and, for every n, a sort for the functions $s : M^n \to \mathbb{R}$ that are almost always 0.

These functions are interpreted as (signed and fractional) multisets . Namely $s(a)$ interpreted as the number of times a occurs in s. We use the following suggestive notation:

1. $$a \in s \;=\; |s(a)| \qquad \text{this is called the multiplicity of } a \text{ in } s;$$

2. $$|s| \;=\; \sum_{a \in M} a \in s \qquad \text{this is called the size of } s;$$

3. $$\big|\{a \in s \,:\, \varphi(a\,;b)\}\big| \;=\; \sum_{a \vDash \varphi(x;b)} a \in s.$$

We call these multisets samples and refer to their sorts collectively as sample-sort .

We will write M^{f} for the expansion above. The language of M^{f} is denoted by L^{f}. It expands L, the language of rings, and the language of vector spaces over $\mathbb{R}$. Each interpreted in the obvious sort. Moreover, L^{f} has a symbols for the functions in 1-3 above. In particular, 3 requires a symbol for every $\varphi(x\,;z) \in L$.

Let $\mathcal{U}$ be a monster model of cardinality κ, a cardinal larger than the cardinality of L. We introduce two elementary extension of $\mathcal{U}^{\mathrm{f}}$.

2.1 Definition *We denote by $\mathcal{U}^{\mathrm{f}*}$ a saturated elementary extension of $\mathcal{U}^{\mathrm{f}}$ of cardinality κ. As all saturated models of cardinality κ are isomorphic, we can assume that $\mathcal{U}$ is the home-sort of $\mathcal{U}^{\mathrm{f}*}$. We denote by $\mathcal{U}^{\mathrm{f}^+}_*$ some elementary extension of $\mathcal{U}^{\mathrm{f}*}$ that realizes all types in $S(\mathcal{U}^{\mathrm{f}*})$. Hence we have $\mathcal{U}^{\mathrm{f}} \prec \mathcal{U}^{\mathrm{f}*} \prec \mathcal{U}^{\mathrm{f}^+}_*$. Elements of sample-sort in these models are called* finite samples, internal samples, *and* (external) samples *respectively.* □

The use of $\mathcal{U}^{\mathrm{f}^+}_*$ is not ideal, it is introduced to replace the use of global types of sample-sort which also have drawbacks.

We write $\text{supp}(s)$ for the support of s, that is, the set of those a in $\mathcal{U}^{\mathrm{f}^+}_*$ such that $a \in s$ is positive.

Let s be an external sample. For every formula $\varphi(x\,;z) \in L$ and every $b \in \mathcal{U}^{|z|}$ we define

$$\text{Av}_{x/s}\varphi(x\,;b) \;=\; \frac{\big|\{a \in s \,:\, \varphi(a\,;b)\}\big|}{|s|},$$

When possible we abbreviate $\text{Av}_{x/s}\varphi(x\,;b)$ with $\overline{\varphi}(s\,;b)$.

Below, ε always ranges over the positive standard reals. If a and b are hyperreals, we write $a \approx_\varepsilon b$ for $|a - b| < \varepsilon$. We write $a \approx b$ if $a \approx_\varepsilon b$ holds for every ε. We write $\text{st}(a)$, for the standard part of the hyperrational number a. That is, the unique real number μ such that $\mu \approx a$.

The standard part of Av_s induces a finite probability measure on the algebra of definable subsets of $\mathcal{U}^{|x|}$. This measure has an unique extension to a Lebesgue probability measure on a σ-algebra. This is known as the Loeb measure.

2.2 Definition *Let $\varphi(x\,;z) \in L$ and M be given. We say that a sample s is smooth if, for every $s' \equiv_M s$ and every $b \in \mathcal{U}^{|z|}$, we have $\overline{\varphi}(s'\,;b) \approx \overline{\varphi}(s\,;b)$. When $\varphi(x\,;z)$ and M are not clear from the context we will say smooth for $\varphi(x\,;z)$ over M.* □

2.3 Definition *Let $\varphi(x\,;z) \in L$ and M be given. An external sample s is*

1. *invariant if, for every $b, b' \in \mathcal{U}^{|z|}$ such that $b \equiv_M b'$, we have $\overline{\varphi}(s\,;b) \approx \overline{\varphi}(s\,;b')$.*

2. *definable if, for every ε, the set $\{b \in \mathcal{U}^{|z|} : \overline{\varphi}(s\,;b) < \varepsilon\}$ is definable over M.*

3. *satisfiable if, for all $b \in \mathcal{U}^{|z|}$, if $\overline{\varphi}(s\,;b) > \varepsilon$, then $\varphi(r\,;b) > \varepsilon$ for some $r \in M^{\mathrm{f}}$.*

4. *generically stable if all of the above hold.* □

Smooth roughly means internal and invariant.

2.4 Fact *Let $\varphi(x\,;z) \in L$ and M be given. The following are equivalent for every external sample s*

1. *s is smooth;*

2. *there is an invariant internal sample $s' \equiv_M s$.*

Proof 1⇒2. Let s be smooth and let $s' \equiv_M s$ be any internal sample. If $b, b' \in \mathcal{U}^{|z|}$ and $b \equiv_M b'$, then $b' = fb$ for some $f \in \text{Aut}(\mathcal{U}^{\mathrm{f}}_*/M)$. Then $\overline{\varphi}(s'\,;fb) \approx \overline{\varphi}(f^{-1}s'\,;b)$. Moreover, by smothness $\overline{\varphi}(f^{-1}s'\,;b) \approx \overline{\varphi}(s'\,;b)$. The infariace in s' follows.

2⇒1. It suffices to prove that if s is internal and invariant then it is smooth. Suppose for a contradiction that there is an $s' \equiv_M s$ busuch that $\overline{\varphi}(s'\,;b) \not\approx_\varepsilon \overline{\varphi}(s\,;b)$. Pick a internal sample $s'' \equiv_{M,s} s'$. Then $\overline{\varphi}(s''\,;b) \not\approx_\varepsilon \overline{\varphi}(s\,;b)$. As $s'' \equiv_M s$ are both in $\mathcal{U}^{\mathrm{f}}_*$, then $s'' = fs$ for some $f \in \text{Aut}(\mathcal{U}^{\mathrm{f}}_*/M)$. Hence we obtan $\overline{\varphi}(s\,;f^{-1}b) \not\approx_\varepsilon \overline{\varphi}(s\,;b)$ which contradics the invariance of s. □

2.5 Fact *For any given $\varphi(x\,;z) \in L$ and M, smooth samples are generically stable.*

Proof Assume s is smooth and prove in turn 1-3 of Definition 2.3.

1. Invariance follows immediately from Fact 2.4.

2. Note that the set $\{b \in \mathcal{U}^{|z|} : \bar{\varphi}(s\,;b) < \varepsilon\}$ is definable in $\mathcal{U}^{\mathfrak{f}_*}$. In fact, by the smoothness of s, we may replace s with any internal sample $s' \equiv_M s$. By what proved above, this set is invariat over M. Therefore it is definable over $M^{\mathfrak{f}}$, or equivalently, over M.

3. Let $b \in \mathcal{U}^{|z|}$ be such that $\bar{\varphi}(s\,;b) > \varepsilon$. Pick a sample s' such that $s \equiv_M s' \underset{M^{\mathfrak{f}}}{\perp} b$. By the smoothness of s, we obtain $\bar{\varphi}(s'\,;b) > \varepsilon$. Let $r \in M^{\mathfrak{f}}$ such that $\bar{\varphi}(r\,;b) > \varepsilon$. $\qquad\square$

The following is a useful characterization of smoothness.

2.6 Lemma *Let $\varphi(x\,;z) \in L$ and M be given. The following are equivalent for every external sample s*

1. *s is smooth;*

2. *for every $b \in \mathcal{U}^{|z|}$ there is a finite sample $r \in M^{\mathfrak{f}}$ such that $\bar{\varphi}(s\,;b) \approx_{\varepsilon} \bar{\varphi}(r\,;b)$ (the sample r depends on ε and b);*

3. *there are some finite samples $r_1, \dots, r_n \in M^{\mathfrak{f}}$ such that for every $b \in \mathcal{U}^{|z|}$ we have $\bar{\varphi}(s\,;b) \approx_{\varepsilon} \bar{\varphi}(r_i\,;b)$ for some r_i (the samples $r_1, \dots, r_n$ as well as the number n depend on ε, but not on b);*

4. *there are finitely many formulas $\vartheta_i(x) \in L(M)$ such that for every $b \in \mathcal{U}^{|z|}$ we have that $\vartheta_i(x) \to \varphi(x\,;b) \to \vartheta_j(x)$ and $\bar{\vartheta}_j(s) - \bar{\vartheta}_i(s) < \varepsilon$ for some i, j.*

Proof 1$\Rightarrow$2. Let $b \in \mathcal{U}^{|z|}$ be arbitrary. Let μ be the standard part of $\bar{\varphi}(s\,;b)$. Let s' be a sample such that $s \equiv_M s' \underset{M^{\mathfrak{f}}}{\perp} b$. By smoothness, $\bar{\varphi}(s'\,;b) \approx \mu$. As $s' \underset{M^{\mathfrak{f}}}{\perp} b$ there is an $r \in M^{\mathfrak{f}}$ such that $\bar{\varphi}(r\,;b) \approx_{\varepsilon} \mu$.

1$\Rightarrow$3. Let $s' \equiv_M s$ be an internal sample. By smoothness we it suffices to prove 3 with s' for s. The type

$$p(z) \quad = \quad \left\{ \bar{\varphi}(s'\,;z) \not\approx_{\varepsilon} \bar{\varphi}(r\,;z) \ : \ r \in M^{\mathfrak{f}} \right\}$$

is inconsistent by 2 (clearly s' is smooth). Hence compatness yields the required $r_1, \dots, r_n \in M^{\mathfrak{f}}$.

The proof of equivalence 3 $\Leftrightarrow$ 4 is left to the reader. The other implications are evident. $\qquad\square$

2.7 Definition *Let $\varphi(x\,;z) \in L$ and M be given. Let $\mathcal{B} \subseteq \mathcal{U}^{|z|}$ be arbitrary. We say that s is* approximable *on $\mathcal{B}$ if for every ε there is a finite sample $r \in M^{\mathfrak{f}}$ such that $\bar{\varphi}(s, b) \approx_{\varepsilon} \bar{\varphi}(r, b)$ for every $b \in \mathcal{B}$. (The sample r depends on ε.) We add* for $\varphi(x\,;z)$ over M *when these are not clear from the context.* $\qquad\square$

2.8 Lemma *Let $\varphi(x\,;z) \in L$ and M be given. Let s be approximable on $\mathcal{B}$ and such that*

$\overline{\varphi}(s\,;b) > \varepsilon$ for every $b \in \mathcal{B}$. Then there is a finite cover of $\mathcal{B}$, say $\mathcal{B}_1, \ldots, \mathcal{B}_n$, such that all types $p_i(x) = \{\varphi(x\,;b) : b \in \mathcal{B}_i\}$ are consistent.

Proof Let $r \in M^{\mathrm{f}}$ be as in Definition 2.7. As r is finite, we may assume that $\mathrm{supp}(r) = \{a_1, \ldots, a_n\}$. Let $\mathcal{B}_i = \{b \in \mathcal{B} : \varphi(a_i\,;b)\}$. As $\overline{\varphi}(r\,;b) > 0$ for all $b \in \mathcal{B}$, these $\mathcal{B}_i$ are the required cover of $\mathcal{B}$. $\qquad\square$

2.9 Corollary *Let $\varphi(x\,;z) \in L$ and M be given. If s be approximable on $\langle b_i : i < \omega \rangle$, where $\langle b_i : i < \omega \rangle$ is a sequence of indiscernibles such that $\overline{\varphi}(s\,;b_i) > \varepsilon$ for every $i < \omega$, then the type $\{\varphi(x\,;b_i) : i < \omega\}$ is consistent.* $\qquad\square$

2.10 Corollary *Let $\varphi(x\,;z) \in L$ and M be given. Let s be approximable on $\mathcal{C}$. Then for every ε there is a pair of distict $c, c' \in \mathcal{C}$ such that $\mathrm{Av}_{x/s}\big[\varphi(x\,;c) \not\leftrightarrow \varphi(x\,;c')\big] < \varepsilon$*

Proof Suppose for a contradiction that $\mathrm{Av}_{x/s}\big[\varphi(x\,;c) \not\leftrightarrow \varphi(x\,;c')\big] \geq \varepsilon$ for all $c, c' \in \mathcal{C}$. Apply Lemma 2.8 to the folmula $\psi(x\,;z,z') = [\varphi(x\,;z) \not\leftrightarrow \varphi(x\,;z')]$ and the set $\mathcal{B} = \{\langle c, c' \rangle \in \mathcal{C}^2 : c \neq c'\}$. The sets $\mathcal{B}_i$ obtained from Lemma 2.8 induce a finite coloring of the complete graph on $\mathcal{C}$. By the Ramsey theorem there is an infinite monochromatic set $A \subseteq \mathcal{C}$. Hence $\{\varphi(x\,;a) \not\leftrightarrow \varphi(x\,;a') : a, a' \in A, a \neq a'\}$ is consistent. As $|A| > 2$, this is impossible. $\qquad\square$

3 The nip formulas

3.1 Theorem *Let $\varphi(x\,;z) \in L$ and M be given and assume that $\varphi(x\,;z)$ is nip. Then every sample is approximable on M over M.*

Proof Questo è Vapnik-Chervonenkis. $\qquad\square$

For smooth samples the Vapnik-Chervonenkis Theorem can be strengthened as follows. (The difference is that below b ranges over $\mathcal{U}^{|z|}$.)

3.2 Corollary *Let $\varphi(x\,;z) \in L$ be nip. Every smooth sample s is approximable on $\mathcal{U}$ over M.*

Proof By Theorem 3.1, there is an $r \in M^{\mathrm{f}}$ such that $\overline{\varphi}(s\,;b) \approx_{\varepsilon} \overline{\varphi}(r\,;b)$ for all $b \in M^{|z|}$.

Suppose for a contradiction that $\overline{\varphi}(s\,;b') \not\approx_{\varepsilon} \overline{\varphi}(r\,;b')$ for some $b' \in \mathcal{U}^{|z|}$. Pick a $s' \subseteq \mathcal{U}^{|x|}$ such that $b' \mathop{\underset{M}{\smile}} s' \equiv_M s$. By the smoothness of s, we obtain $\overline{\varphi}(s'\,;b') \not\approx_{\varepsilon} \overline{\varphi}(r\,;b')$. As $b' \mathop{\underset{M}{\smile}} s'$, the same formula holds for some $b \in M^{|z|}$. Once again by smoothness, $\overline{\varphi}(s\,;b) \not\approx_{\varepsilon} \overline{\varphi}(r\,;b)$. A contradiction. $\qquad\square$

3.3 Definition *A formula $\varphi(x\,;z) \in L$ is distal if there is a formula $\psi(x\,;z_1, \ldots z_n) \in L$ such that for every finite set $A \subseteq \mathcal{U}^{\mathrm{f}}$ and every $b \in \mathcal{U}^{|x|}$ there are $a_1, \ldots, a_n \in \mathrm{supp}(s)$ such that $\psi(x\,;a_1, \ldots, a_n) \leftrightarrow p(x)$, where $p(x) = \mathrm{tp}_{\varphi}(b/A)$.* $\qquad\square$

3.4 Theorem (false) *The following are equivalent*

1. $\varphi(x;z) \in L$ is distal;

2. for every sample $s \in \mathcal{U}^{\mathfrak{f}^+}_*$, if s is generically stable for $\varphi(x;z)$ over M then s is smooth for $\varphi(x;z)$ over M.
